## 1d phase retrieval

#### Given the oversampled Fourier transform magnitudes $|\mathcal{F}(x)|^2$ , recover x.

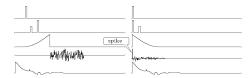

Frequency-resolved optical gating (FROG)

#### Wavelet-based speech processing

## Spectral Factorization

 $\mathsf{PR}: |\mathcal{F}(x)|^2 \mapsto x \Longleftrightarrow \mathsf{spectral factorization}: x \star x \mapsto x$ 

Usually no unique solution (very different than 2D case!)Eg:

$$(6,5,-1) \star (6,5,-1) = (6,-35,62,-35,6)$$
  
 $(3,-7,2) \star (3,-7,2) = (6,-35,62,-35,6)$ 

<ロト <問ト < 目ト < 目ト

Usually no unique solution (very different than 2D case!)Eg:

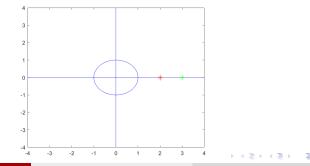

$$(6,5,-1) \star (6,5,-1) = (6,-35,62,-35,6)$$
  
 $(3,-7,2) \star (3,-7,2) = (6,-35,62,-35,6)$ 

$$6 + 5z - z^2 = (z - 2)(z - 3) \rightarrow \text{Roots} : r_1 = 2, r_2 = 3$$
  
 $3 - 7z + 2z^2 = 2(z - 1/2)(z - 3) \rightarrow \text{Roots} : r_1 = 1/2, r_2 = 3$ 

э

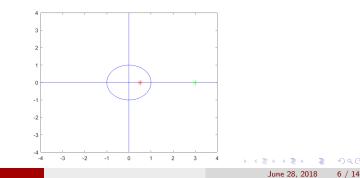

< □ > < □ > < □ > < □ > < □ >

In general, all solutions obtained by flipping roots in the unit circle,  $r\mapsto \overline{r}^{-1}$ .

In general, all solutions obtained by inverting roots in the unit circle,  $r\mapsto \overline{r}^{-1}$ .

$$6 + 5z - z^{2} = (z - 2)(z - 3) \rightarrow \text{Roots} : r_{1} = 2, r_{2} = 3$$
$$3 - 7z + 2z^{2} = 2(z - 1/2)(z - 3) \rightarrow \text{Roots} : r_{1} = 1/2, r_{2} = 3$$

- In general, for a signal  $x \in \mathbb{R}^n$ , up to  $2^n$  possible solutions. (One for each root inversion.)
- Special case: *Z*{*x*} has all its roots on the unit circle. → Unique solution!

## Least-squares minimization

Given  $r = x \star x$ , solve:

$$\min_{x} f(x) = \frac{1}{2} \|r - x \star x\|^{2}.$$
 (1.1)

L → ব E → E ∽৭ে June 28, 2018 8 / 14

#### Least-squares minimization

Given  $r = x \star x$ , solve:

$$\min_{x} f(x) = \frac{1}{2} \|r - x \star x\|^{2}.$$
(1.1)

Nonconvex function (⇒ in general NP-hard to find global minimum)
 Can we achieve success?

## Why we care about least-squares

When any feasible global minimizer is acceptable, or x is root-unitary.

- When we can regularize to a particular solution (add priors).
  - Sparsity (*I*<sub>1</sub>-regularization)
  - Symmetry
  - Known support

< □ > < 同 > < 回 > < 回 > < 回 >

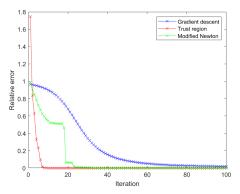

## History: Wilson's method for spectral factorization

- (Wilson, 1969): Start from x = [1; 0, ..., 0] and apply Newton-Raphson to find the roots of g(x) = r - x ★ x.
- Surprise: guaranteed recovery!
- Observation: Newton-Raphson is equivalent to Gauss-Newton on a least-squares objective.

イロト イポト イヨト イヨト

# Is Gauss-Newton special?

- Many numerical optimization algorithms:
  - Gradient descent
  - Trust region
  - Modified Newton
  - Many others...
- $\blacksquare \Rightarrow AII achieve success!$

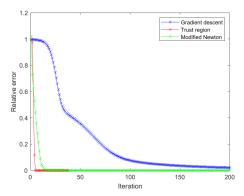

Case 1: the ground-truth  $x^*$  is Gaussian random.

4 A I

# Is Gauss-Newton special?

- Many numerical optimization algorithms:
  - Gradient descent
  - Trust region
  - Modified Newton
  - Many others...
- $\blacksquare \Rightarrow \mathsf{AII} \text{ achieve success!}$

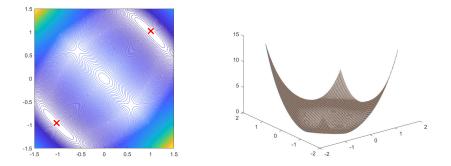

Case 2: the ground-truth x\* has all its roots on the unit circle. (Problematic for other methods.)
